About Me

Cybersecurity engineering undergraduate specializing in web application security, vulnerability testing, and threat monitoring. Acknowledged by the NCIIPC (Govt. of India) for identifying critical web vulnerabilities in state infrastructure. Possesses a rigorous foundation in enterprise networking (currently pursuing CCNA) alongside established credentials in Network Defense and Cyber Threat Management. Proficient in manual testing for OWASP Top 10 vulnerabilities using Burp Suite and Nmap, with a strong background in analyzing system logs and collaborating with development teams to implement secure coding practices.

Education

Bachelor of Engineering in Cybersecurity, Karpagam Academy Of Higher Education 2023 – 2027
CGPA: 7.68/10

Skills

Network Security
Firewalls, Packet Analysis, Nmap, Wireshark, Nessus

Web Security
XSS, SQL Injection, CSRF, OWASP Top 10

Programming
Python (Pandas, Scikit-learn), Bash, Flask

Tools
Burp Suite, Metasploit, Nmap, Nessus, Acunetix

Offensive Security
Penetration Testing, Red Teaming, Bug Bounty, OSINT

Splunk

Certificates

Cisco Certified Network Associate (CCNA)
In Progress (Expected 2026)

Cisco Networking Academy
Ethical Hacker, Network Defense, Endpoint Security, Cyber Threat Management

IBM
Ethical Hacking & Penetration Testing

Additional — Bug Bounty & WiFi Pentesting

VULNERABILITY DISCLOSURES

NCIIPC (Govt. of India) - Security Acknowledgement
Identified and reported critical Username Enumeration and Directory Listing vulnerabilities in state government web infrastructure using manual testing and OSINT techniques, resulting in official acknowledgement from India's National Critical Information Infrastructure Protection Centre (NCIIPC).

Projects

Vulnerability Scanning & Log Monitoring Home Lab, Burp Suite, Nmap, Server Logs

- Deployed a continuous vulnerability scanning environment against intentionally vulnerable web applications.
- Configured system logging to aggregate traffic, isolate suspicious HTTP requests, and report anomalous network activity.

Optimal Transport Based Network Intrusion Detection System

- Built an AI-powered IDS using Optimal Transport theory and Wasserstein distance metrics to detect distributional anomalies in network traffic, achieving higher detection accuracy than traditional threshold-based methods.
- Processed and engineered features from benchmark network datasets using Python (Pandas, Scikit-learn), training ML classification models to distinguish normal vs. malicious traffic patterns.
- Reduced false positive rate by ~20% compared to baseline classifiers, enabling more reliable threat detection in real-time network environments.

AI-Powered Fraud Prevention System, Python, Flask, AI Behavioral Analytics

- Developed a threat intelligence web app to detect phishing domains in real-time without relying purely on signatures.
- Designed secure REST APIs, ensuring the application strictly adhered to OWASP secure coding standards.

Locospy — Geolocation Capture Security Tool, *Bash, Flask, Cloudflare Tunnels*

- Engineered a red-teaming tool to simulate social engineering vectors, securing local servers via Cloudflare Tunnels.
- Implemented real-time log monitoring via Bash scripting to instantly surface data, mirroring enterprise SOC workflows.
